SKILLS

FRONTEND

- React.js
- TypeScript
- JavaScript
- Redux
- Zustand
- Material UI
- NextJS
- HTML/CSS
- SCSS

BACKEND

- Node.js
- Express
- GraphQL
- REST APIs
- PHP

DATABASES

- MongoDB
- Mongoose
- MySQL
- PostgreSQL
- DynamoDB
- BigQuery

CLOUD

- AWS Lambda
- AWS S3
- AWS CloudWatch
- AWS DynamoDB
- AWS SQS
- AWS Fargate
- AWS ECS
- AWS EC2
- AWS MQ

DEVOPS

- Docker
- Kubernetes

TESTING

- Jest
- TestCafe

TOOLS

- GitHub
- GitLab
- Bitbucket
- Jira
- Teamwork

OTHER

- SocketIO
- RabbitMQ
- Auth0
- Stripe

EDUCATION

B.Sc. in Computer Science Engineering

"Aurel Vlaicu" University
2023

M.P.A. in Finance and Management

"Aurel Vlaicu" University
2011

Bachelor of Public Administration

"Aurel Vlaicu" University
2009

ABOUT ME

Full Stack Engineer with over 8 years of experience building scalable web applications and cloud solutions. Proficient in React, Node.js, TypeScript, and Docker, with 8+ years of hands-on Node.js development across diverse production environments. Extensive experience with AWS services including Lambda, S3, CloudWatch, DynamoDB, SQS, MQ, Fargate, ECS, and EC2 — emphasizing secure, performant, and maintainable architectures. Contributed to high-impact platforms such as Oxford University Press and led cloud migration efforts. Recognized for strong problem-solving skills and driving agile process improvements across cross-functional teams.

WORK EXPERIENCE

WE AS WEB

Jun. 2025 - Jun. 2026

Backend Software Engineer

Project: The Range

A leading UK multi-category retailer operating a fast-growing online marketplace ecosystem, with a large catalog spanning home, garden, sports, and fashion categories.

Contributed to the backend development of The Range marketplace platform, with a primary focus on integrating Mirakl Marketplace and Ads services into the existing architecture. The work involved designing and implementing reliable data pipelines for catalog synchronization, offer updates, and seller/store data flows, capable of processing large datasets at scale. A key challenge was ensuring data consistency between internal systems and the Mirakl platform, particularly when handling high-volume catalog operations and real-time offer changes. The project followed agile methodologies with a distributed team, requiring close collaboration across backend, frontend, and DevOps disciplines.

Roles: Backend Engineer, Mirakl Integration Specialist, Data Pipeline Developer

Team: ~6 engineers (2 backend, 2 frontend, 1 DevOps, 1 QA)

- Designed and implemented backend services for integrating Mirakl Marketplace and Ads APIs into the existing platform, ensuring accurate product catalog synchronization and offer updates.
- Built scalable data processing pipelines capable of handling large datasets from BigQuery, applying filtering and transformation rules before syncing with Mirakl.
- Developed seller and store data flow modules, ensuring consistency between internal systems and the Mirakl platform.
- Collaborated with the DevOps team to containerize services using Docker and deploy them on AWS infrastructure.
- Participated in code reviews, wrote technical documentation, and contributed to sprint planning within an agile workflow.
- Investigated and resolved data inconsistencies between internal catalog systems and Mirakl, improving data reliability across the marketplace.

Tools & Tech: TypeScript, Node.js, AWS, Docker, MySQL, BigQuery, Mirakl API, Git

NC-VISION

Jul. 2024 - Apr. 2025

Full Stack Engineer

Project: NC-Vision Platform

NC-Vision is a software company delivering a no-code platform aimed at modernizing manufacturing IT systems for enterprise clients in industrial sectors.

Contributed to the ongoing development of a no-code visual platform that enables enterprise users in the manufacturing sector to design, configure, and deploy custom applications through an intuitive drag-and-drop interface. The platform bridges the gap between visual tooling and traditional programming, offering the flexibility of code-level customization where needed. Work involved both React frontend development and Node.js backend contributions, with a strong focus on component architecture, dialog systems, real-time communication via SocketIO, and test coverage through end-to-end testing with TestCafe. The codebase followed a modular architecture with an emphasis on reusability and consistency across a large, feature-rich application.

Roles: Full Stack Engineer, Feature Developer, Bug Fix Engineer, Code Reviewer

Team: ~10 engineers (4 frontend, 3 backend, 1 DevOps, 1 QA, 1 Tech Lead)

- Developed and maintained React-based UI components using Material UI, implementing features such as date pickers with timezone handling, user profile dialogs, and backup management dialogs.
- Refactored legacy non-React dialogs and components into modern React + TypeScript architecture, improving maintainability and consistency across the application.
- Built reusable generic dialog components (DialogHeader, DialogContent, DialogFooter, DialogWrapper) adopted across the application for a consistent UX pattern.
- Implemented SocketIO-based real-time task progress tracking for backup operations, including loaders, pagination, and refresh logic.
- Wrote and maintained end-to-end tests using TestCafe, ensuring feature stability and regression coverage for new and refactored components.
- Participated in code reviews, contributed to agile sprints via GitLab, and provided technical input during architectural discussions.
- Investigated and fixed bugs across both frontend and backend layers, including issues with fullscreen app behavior, default field values, and search result inconsistencies.

LANGUAGES

Romanian — Native
English — Very Good (C1)

AWARDS

Oct 2023 | Oxford University Press
Certificate of Appreciation

Tools & Tech: React, TypeScript, Node.js, MySQL, AWS, Docker, Material UI, SocketIO, TestCafe, Git, GitLab

SOFTBINATOR

Feb. 2024 – Jun. 2024

Full Stack Engineer

Project: ASCERA

ASCERA is a security compliance software company providing tools that automate evidence collection and status reporting for organizations managing compliance frameworks.

Contributed to a significant infrastructure migration initiative, moving AWS-hosted application services to a fully containerized architecture using Docker and Kubernetes, targeting both local development and on-premise enterprise deployment scenarios. The migration aimed to reduce dependency on cloud vendor lock-in, improve horizontal scalability, and enable self-hosted deployments for compliance-sensitive clients. In parallel, backend services were refactored to use Fastify as the HTTP framework, resulting in improved request throughput and reduced latency. The project required strong collaboration between backend and DevOps engineers to align service configurations, networking, and deployment pipelines across environments.

Roles: Full Stack Engineer, DevOps Contributor, Migration Engineer Team: ~5 engineers (2 full-stack, 1 DevOps, 1 backend, 1 QA)

- Participated in the migration of cloud-based AWS infrastructure to Docker and Kubernetes for both local and on-premise deployment environments.
- Refactored backend services to use Fastify as the HTTP framework, improving performance and reducing overhead compared to the previous solution.
- Configured and maintained Docker containers and Kubernetes manifests, ensuring reliable service orchestration across environments.
- Integrated RabbitMQ for asynchronous messaging between microservices, improving decoupling and resilience.
- Collaborated with the DevOps engineer to align infrastructure configurations with application requirements.
- Tested migration results to ensure functional parity between cloud and on-premise deployments, documenting findings and resolving discrepancies.

Tools & Tech: React, Node.js, PostgreSQL, AWS, TypeScript, Docker, Kubernetes, RabbitMQ, Git, Bitbucket

COGNIZANT

Mar. 2021 – Feb. 2024

Full Stack Engineer

Project: Oxford University Press

Oxford University Press is a globally recognized academic publisher and one of the world's largest university presses, delivering educational content to millions of users across 190+ countries.

Contributed to the development and maintenance of an advanced English language teaching platform serving millions of students, teachers, and administrators across 190+ countries. The platform features granular role-based access control, multilingual support, and a robust content delivery system backed by AWS cloud infrastructure. Work spanned both frontend (React, SCSS) and backend (Node.js, MongoDB) layers, including Auth0-based authentication flows, serverless feature development with AWS Lambda, and thorough test coverage using Jest. The engineering team operated in a large distributed agile organization, with strong emphasis on code quality, peer review, and continuous integration practices.

Roles: Full Stack Engineer, Feature Developer, AWS Integration Engineer, Code Reviewer

Team: ~12 engineers (4 frontend, 4 backend, 2 QA, 1 DevOps, 1 Tech Lead)

- Developed and maintained full-stack features across the English teaching platform, working with React on the frontend and Node.js on the backend.
- Implemented role-based access control logic, ensuring secure and appropriate content access for students, teachers, and admin users.
- Integrated Auth0 for authentication and authorization across the application, managing token flows and session handling.
- Worked with AWS services including Lambda, S3, DynamoDB, SQS, and CloudWatch to build scalable and observable serverless features.
- Wrote unit and integration tests using Jest, maintaining high test coverage across critical application modules.
- Participated in agile ceremonies, code reviews, and cross-team knowledge sharing within a large distributed engineering organization.
- Received a Certificate of Appreciation from Oxford University Press in October 2023 for outstanding contribution to the platform.

Tools & Tech: React, Node.js, MongoDB, AWS (Lambda, S3, DynamoDB, SQS, CloudWatch), TypeScript, Jest, SCSS, Auth0, Docker, Git, GitHub

WELLTECH

Oct. 2018 – Mar. 2021

Full Stack Engineer

Project: Farina London

Farina London is a London-exclusive digital marketplace for authentic Italian bakery products, connecting artisan Italian producers with customers in London.

Built a full-stack e-commerce web application for an exclusive London-based marketplace specializing in authentic Italian artisan bakery products. The platform covers the complete customer journey from product discovery and registration to ordering and payment, with a custom admin CMS for managing products, orders, and content. The backend was designed around a Node.js and Express API with MongoDB for data persistence, while GraphQL was used for flexible and efficient data fetching between layers. Stripe was integrated for secure payment processing, and the project placed strong emphasis on usability, performance, and a smooth end-to-end experience.

Roles: Full Stack Engineer **Team:** ~4 engineers (2 full-stack, 1 designer, 1 QA)

- Developed a NextJS-based frontend with intuitive product browsing, registration, and ordering flows.
- Built RESTful APIs using Node.js, Express, and MongoDB to handle product catalog, orders, and user management.
- Designed and implemented a custom React-based CMS for admin tasks including product management, order tracking, and content updates.
- Integrated Stripe for secure and seamless payment processing.
- Used GraphQL for efficient data fetching between frontend and backend layers.
- Collaborated closely with the designer and QA to deliver a polished, production-ready product.

Tools & Tech: React, NextJS, Node.js, MongoDB, Mongoose, GraphQL, Material-UI, NextJS, Express, Stripe, Git, Bitbucket

Project: Ubooker

Ubooker is a global booking platform connecting models, creators, photographers, and fashion companies worldwide.

Developed a web application for a global booking platform that connects models, creators, photographers, and fashion companies, enabling them to discover and book talent worldwide. The application was built using the SilverStripe PHP framework, with a heavily customized CMS tailored to the specific workflows of the booking industry, including profile management, availability calendars, and booking request flows. Stripe was integrated for secure handling of booking payments and payouts. The project required careful attention to user roles, data integrity, and a clean, professional UI suitable for a fashion-oriented international audience.

Roles: Full Stack Engineer, PHP Developer **Team:** ~3 engineers (2 full-stack, 1 QA)

- Built the Ubooker web application using the SilverStripe PHP framework, customizing the CMS to support booking workflows.
- Implemented Stripe payment integration for managing booking transactions.
- Designed and developed frontend views using HTML, CSS, Bootstrap, and jQuery.
- Maintained and optimized MySQL database schemas to support platform data requirements.
- Worked with the QA team to identify and resolve defects prior to production deployments.

Tools & Tech: PHP, MySQL, HTML, CSS, Bootstrap, jQuery, JavaScript, SilverStripe, Stripe, Git, Bitbucket

MAGONTEC

Mar. 2017 – Sept. 2018

IT Manager

Project: IT Operations Management

Magontec is a leading manufacturer of magnesium alloys and Cathodic Corrosion Protection products made from magnesium and titanium, operating across multiple international sites.

Managed the full spectrum of IT operations for the company, including budget planning, infrastructure security, network design, and stakeholder support.

Roles: IT Manager, Network Administrator, IT Support Lead **Team:** IT team of 2 (self + 1 technician)

- Developed and managed the annual IT budget, evaluating vendors and solutions to ensure cost-effectiveness.
- Monitored and maintained the security of all IT systems and networks, implementing protections against malicious attacks.
- Designed and managed local data networks, ensuring reliability and performance across company sites.
- Established and maintained effective relationships with internal stakeholders and external vendors to provide reliable IT support.
- Implemented and managed data backup solutions, ensuring business continuity and data integrity.
- Maintained security systems including anti-theft and CCTV infrastructure.

Tools & Tech: Windows Server, Linux, Networking, VPN, CCTV, Data Backup Solutions

TEMPONET

Nov. 2012 – Feb. 2017

Computer Engineer & Web Developer

Project: IT Outsourcing & Web Development

Temponet is an IT company specializing in outsourcing IT services and web development for businesses of various sizes.

Provided comprehensive IT and web development services for multiple client businesses, covering website development, server administration, network design, and security system maintenance.

Roles: Web Developer, System Administrator, Network Engineer, IT Support **Team:** ~5 engineers

- Developed websites using PHP and WordPress for various client businesses, handling both frontend and backend development.
- Managed and maintained servers running Windows Server and Linux, including configuration, updates, and performance monitoring.
- Designed and managed client data networks, implementing VPN solutions for secure remote access.
- Installed, configured, and operated IT equipment across client sites, including hardware procurement and setup.
- Implemented data backup solutions and managed database systems for client applications.
- Maintained security systems including anti-theft and CCTV systems across multiple client locations.

Tools & Tech: PHP, WordPress, MySQL, HTML, CSS, JavaScript, Windows Server, Linux, VPN, Networking, Git
